

*Tip 1: Change where cruise handles are located on a shape by placing a new workplane on the desired surface. Then with Cruise active, click on the shape and the handles will realign

*Tip 2: Press Shift when cruising to flip the cruised surface. This works great for making holes

*Tip 3: Press 'E' on your keyboard to bring up the temporary workplane of a cruised shape

Cruise

Easily stack shapes onto surfaces by using the 'magnetic' cruise tool

Rather than placing new shapes onto the workplane, try placing them over another shape's surface. You'll notice it aligning flush with the surface beneath it - allowing you to easily stack without placing a workplane first

Once placed, a temporary workplane appears, which allows you to move, rotate, or scale the shape on the axis that you set it down

You can use the Cruise tool with existing shapes by selecting them and pressing the magnet icon or 'C' on your keyboard. Then drag a handle to cruise it to a new location
